Caitey Gilchrist

BC Bee Atlas Collection and Identification Report - 2024

1 Your 2024 Collections

Caitey Gilchrist caught 0 bees in 2024.

Species (0 total)

Number of specimens

Genera (0 total)

Number of specimens

Families (0 total)

Number of specimens

Figure 1: Bees caught by Caitey Gilchrist, broken down by species, genus, and family.

2 All Your Collections

Caitey Gilchrist caught 14 bees overall, but none have currently been identified to species. Identifying 11875 bees (and counting) takes a long time!

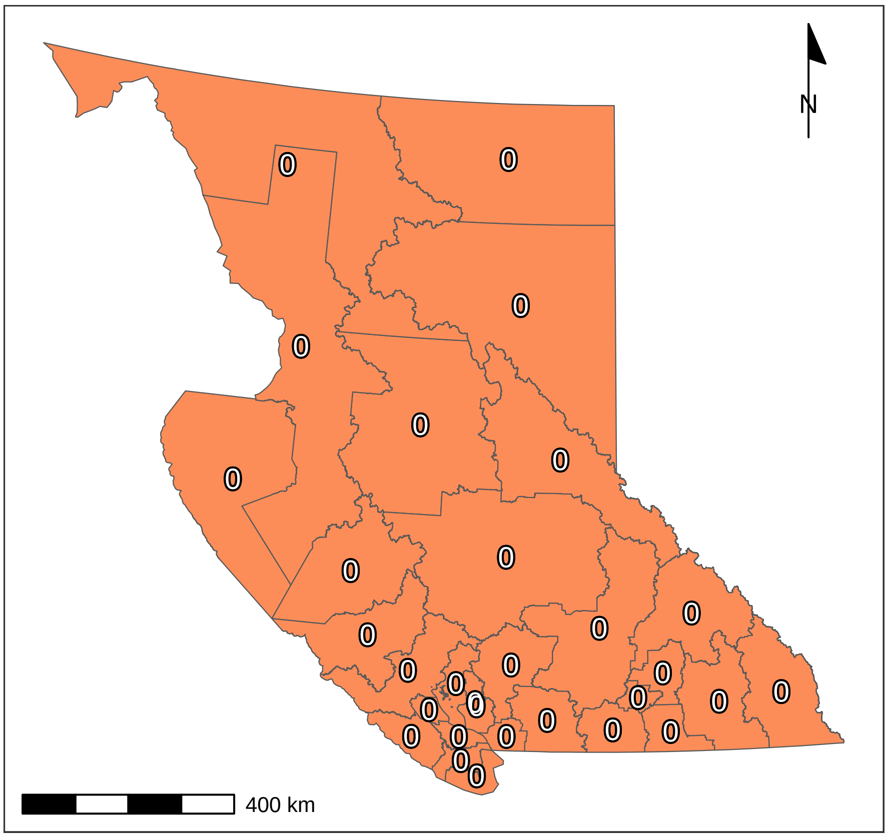

Figure 3: Bee catch locations for Caitey Gilchrist (within British Columbia), along with total catches per region.

3 Total Catches

Volunteers from the British Columbia Bee Atlas project caught 2533 bees across 14 regions from March 16, 2024 to November 07, 2024, representing 135 unique species and 34 unique genera. The **Nimble Net Kudos** (most specimens collected) goes to Bonnie Zand, Monica Zieper, and Jade Lee, who caught a total of 828, 559, and 386 specimens. The *positive* kind of **Darwin Award** (most species collected) goes to Bonnie Zand, Bob McDougall, and Jade Lee, who caught a total of 127, 55, and 51 unique species. Well done!

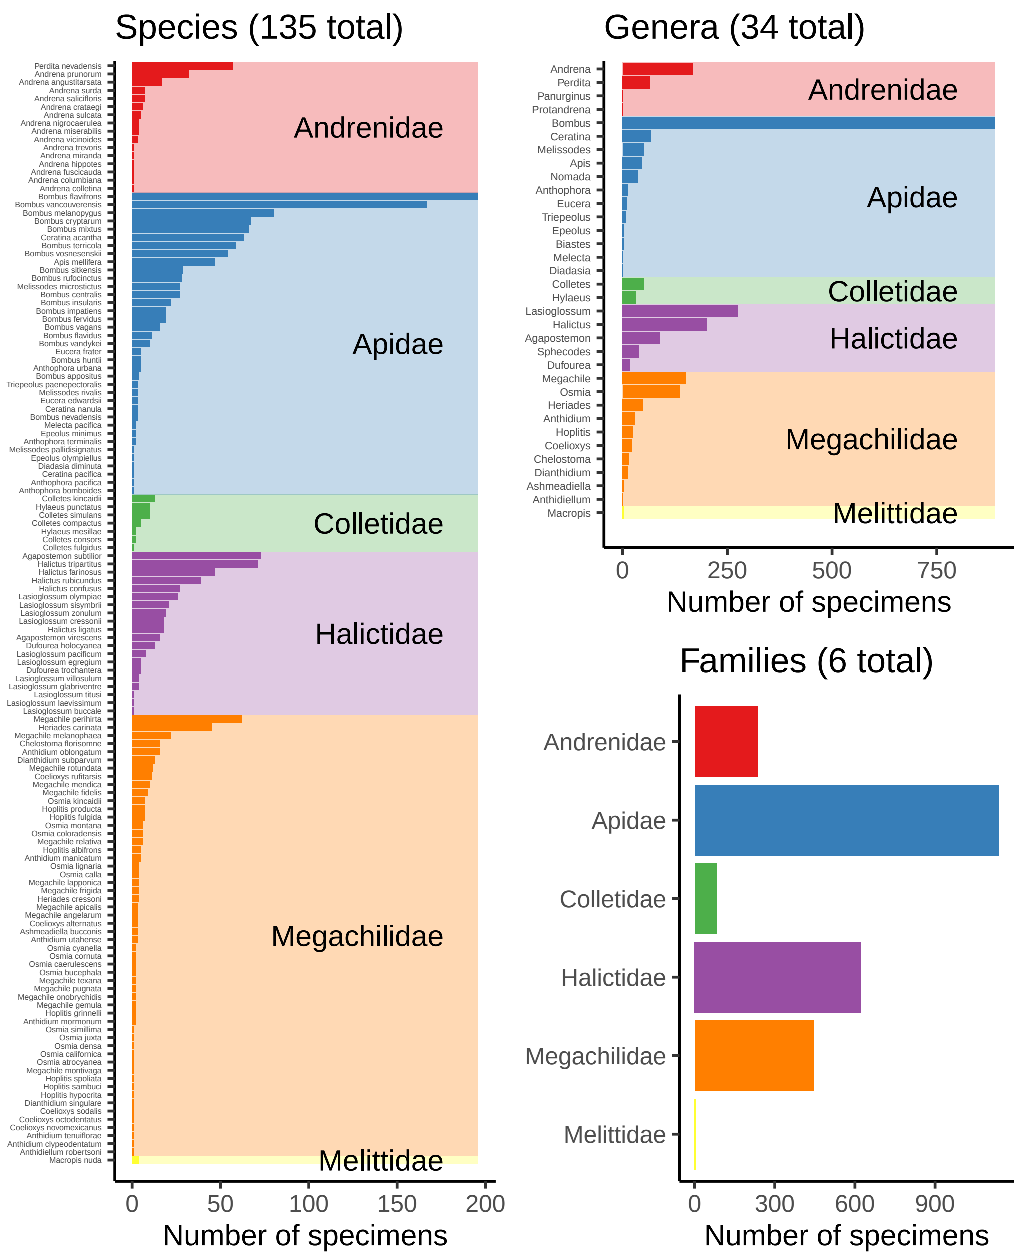

Figure 4: Bees caught by all volunteers, broken down by species, genus, and family.

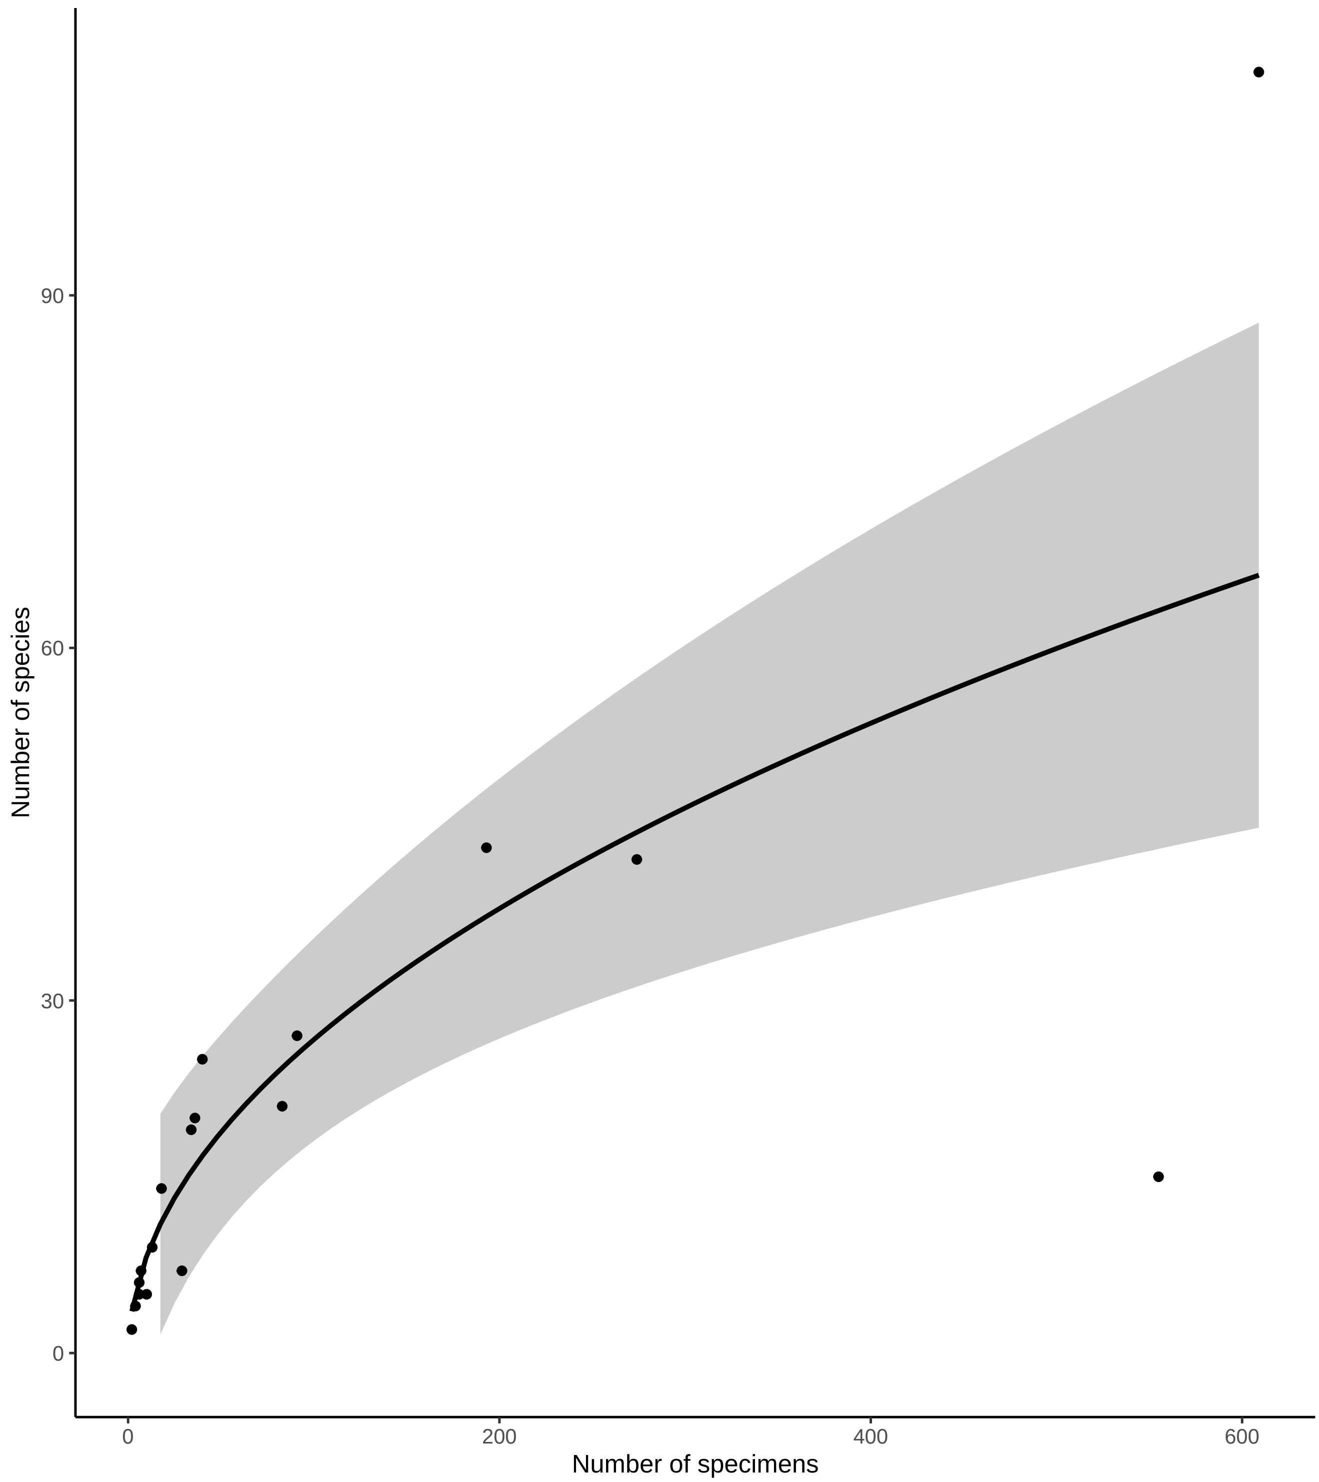

Figure 5: Number of bee specimens and unique bee species caught by all volunteers, with your effort shown in red. This graph should give you an idea of how many specimens you would need to catch to begin seeing rarer bee species.

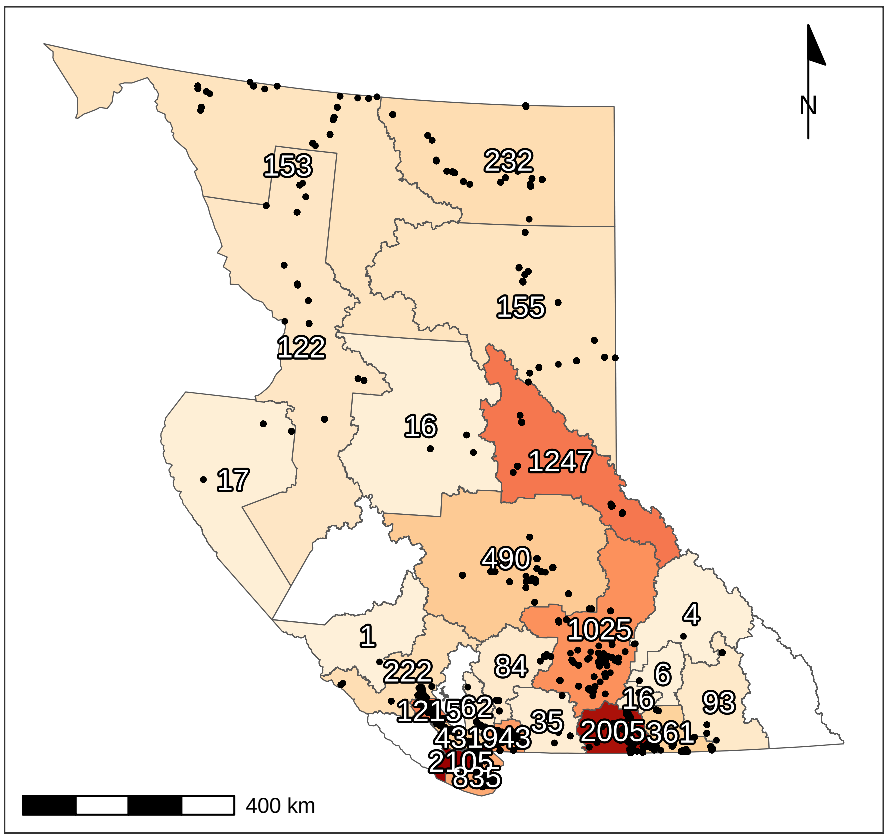

Figure 6: Total specimens caught per region, along with catch location of each specimen (black dots). For genus- and species-specific information for each region, see Tables 3 and 4.

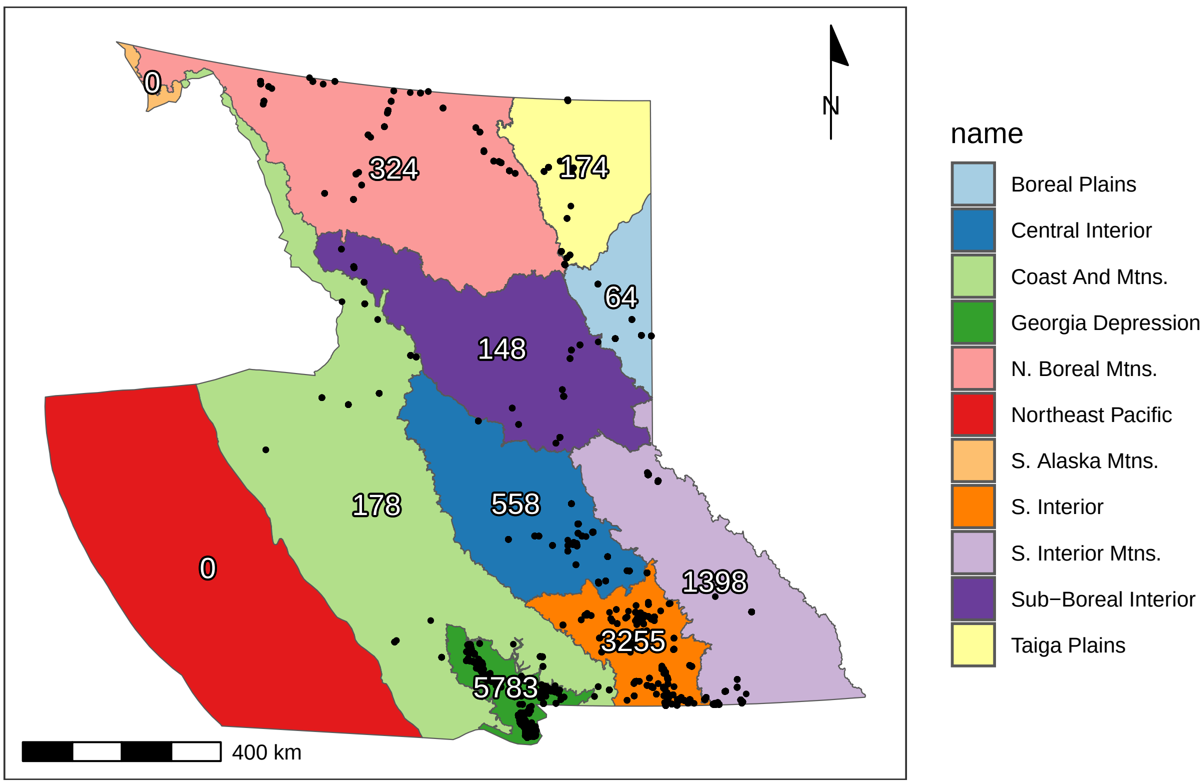

Figure 7: Total catches per ecoprovince, along with catch location of each specimen (black dots).

4 Flight Phenology

Most bees (90%) in British Columbia were caught between May 10 and September 04, but the peak of season (50% of specimens) was from June 23 to August 17.

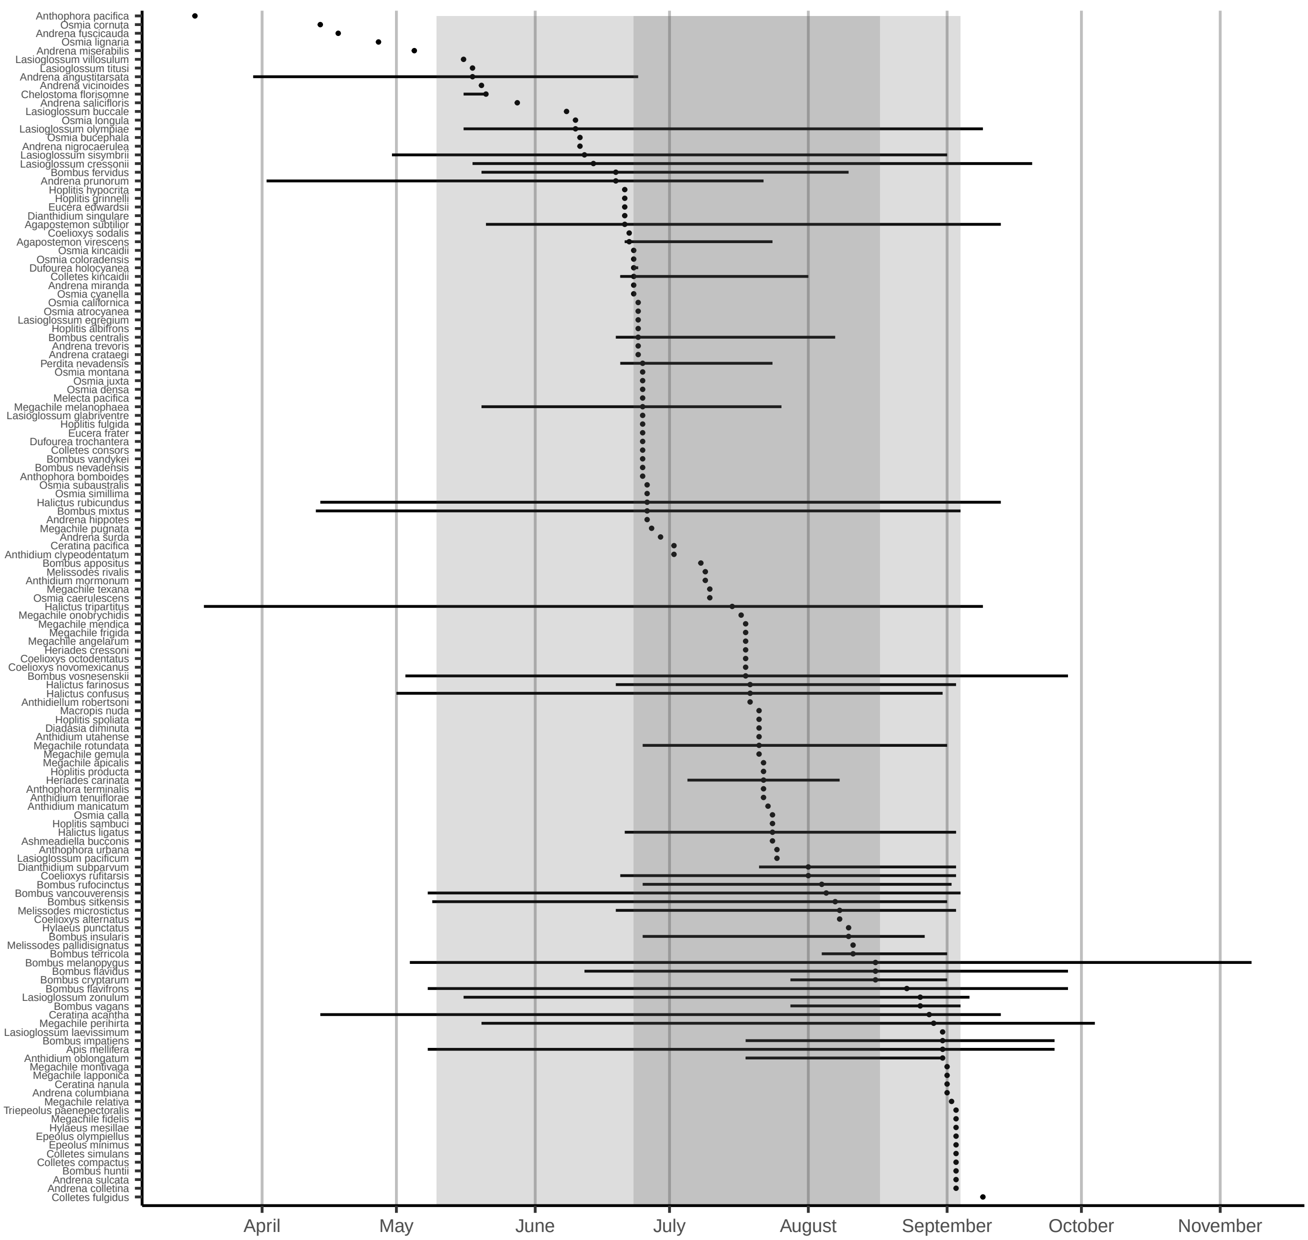

Figure 8: Phenology plot for all bee species caught, sorted by median abundance times. Percentiles of overall emergence times (50th & 90th) are shown in grey shaded regions. Date ranges for each species (minimum, first, second, third quartiles, and maximum) are shown only for species with >10 specimens.

5 Plant genera

Volunteers collected specimens from a total of 134 unique flower genera, with most volunteers sampling from 10.5 flower genera (median value). The **Flower Power Kudos** (most sampled flower genera) goes to Bonnie Zand, Bob McDougall, and Jade Lee, who collected bees from a total of 65, 43, and 39 genera of flowers. Well done!

The flower genera that had the most specimens caught on them were *Grindelia*, *Impatiens*, and *Cirsium*, which yielded a total of 133, 110, and 90 specimens. The flower genera that were popular with the most species of bees were *Grindelia*, *Solidago*, and *Leucanthemum*, hosting a total of 36, 26, and 24 unique bee species. See Tables 1 and 2 for more details.

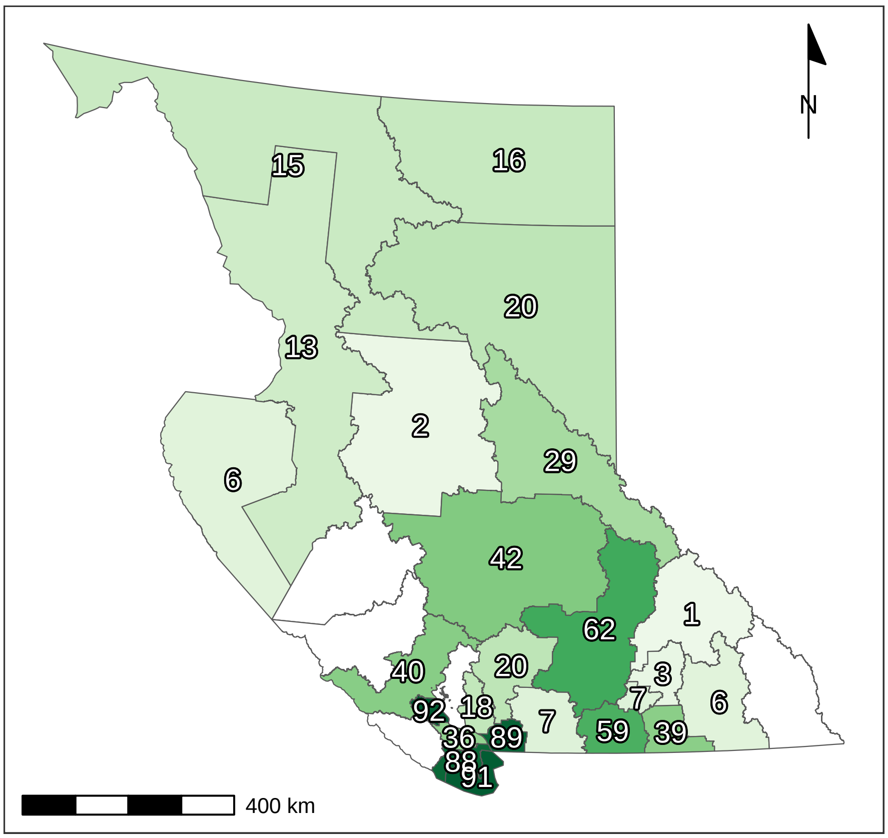

Figure 9: Recorded number of flower genera per region.

Table 1: Number of bee specimens collected from each plant genus. Plants with few records are great targets for future sampling.

Taxon
No specimens identified

7 Taxonomic Accuracy, 2024

In 2024, you did not have specimens that were identified by the British Columbia Bee Atlas (see Table 5). In total, volunteers from the British Columbia Bee Atlas project identified 0 % (0) of the 2533 bee specimens to the level of genus, with an average accuracy of NaN%. Volunteer identifications to species level did not occur or are not included in the data (see Table 6).

No specimens identified

8 Taxonomic Accuracy, All Years

Your collected specimens have not yet been identified by the British Columbia Bee Atlas (see Table 7). In total, volunteers from the British Columbia Bee Atlas project identified 0 % (0) of the 2542 bee specimens to the level of genus, with an average accuracy of NaN%. Volunteer identifications to species level did not occur or are not included in the data (See Table 8).
